Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.The present report concerns a method of computing the velocity and pressure distributions on bodies of revolution in axially symmetrical flow in the subsonic range. The differential equation for the velocity potential  $\Phi$  of a compressible fluid motion is linearized in the conventional manner, and then put in the form  $\Delta(\Phi) = 0$  by affine transformation. The quantity  $\Phi$  represents the velocity potential of a fictitious incompressible flow, for which a constant superposition of sources by sections is secured by a method patterned after von Karman which must comply with the boundary condition  $\frac{\Delta(\Phi)}{\Delta(n)} = 0$  at the originally specified contour. This requirement yields for the pseudo-stream function  $\psi$  a differential equation which must be fulfilled for as many points on the contour as source lengths are assumed. In this manner, the problem of defining the still unknown source intensities is reduced to the solution of an inhomogeneous equation system. The pressure distribution is then determined with the aid of Bernoulli's equation and adiabatic equation of state. Lastly, the pressure distributions in compressible and incompressible medium are...

### Reviews

*Excellent electronic book and valuable one. We have read and so i am sure that i am going to likely to study again once more in the foreseeable future. I am just happy to inform you that here is the very best book i have read during my personal lifestyle and might be the greatest book for possibly.*

*Completely essential read through publication. It normally does not expense excessive. It is extremely difficult to leave it before concluding, once you begin to read the book.*
