This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1865 Excerpt: .of strength will be about nine times the breaking weight, if we suppose the main centre to be overhung as in marine engines. Thus, in a cylinder of 24 inches diameter, and, consequently, of 452 square inches area, the total load on the piston with 20 lbs. on each square inch is 9,040 lbs. But as the strain at the main centre is doubled from the beam acting as a lever of 2 to 1, it follows that the strain at the main centre will be 18,080 lbs. The ultimate tensile strength of common cast-iron being 12,000 per square inch of section, and the tensile and shearing strength being about the same, th of 12,000, or 1,888 lbs., will be the proper load to place on each square inch of section; and 18,080 divided by 1,888 will give the proper sectional area in square inches, which...

Reviews

This publication is very gripping and exciting. Better then never, though i am quite late in start reading this one. I am very happy to inform you that here is the finest pdf i actually have read inside my very own daily life and could be he greatest publication for actually.

-- Dayana Aufderhar

This publication might be worthy of a read through, and superior to other. It normally is not going to charge excessive. Its been written in an remarkably simple way and is particularly just after i finished reading through this book through which in fact transformed me, alter the way i really believe.
